

Nike Sales Analytics Dashboard

DATA ANALYTICS PROJECT

Rahul A R · Built with Power BI

Made with **GAMMA**

Project Objective

This project set out to transform raw Nike sales data into a fully interactive Power BI dashboard – delivering clear, actionable insights that empower smarter, faster, data-driven decisions.

Interactive Dashboard

Build a dynamic, filterable Power BI dashboard that stakeholders can explore in real time

Sales & Profit Analysis

Analyze revenue, profit trends, and regional performance across product categories

Raw Data to Insights

Convert unstructured transactional data into clean, meaningful visual narratives

Decision Support

Equip business teams with the visibility needed to make confident, data-backed decisions

Business Problem

Before this dashboard was built, Nike's sales data existed in silos — raw, disconnected, and nearly impossible to act on. Key performance gaps went undetected because there was no unified system for tracking, analyzing, or reporting.

Unstructured Raw Data

Sales data was spread across multiple sources with no standardization, making analysis error-prone and time-consuming.

No Centralized Tracking

There was no single source of truth for monitoring overall business performance, leading to inconsistent reporting across teams.

Limited Product & Region Insights

It was unclear which products or regions were driving growth — or where performance was falling short.

Discount & Returns Blind Spot

The impact of discount strategies and product return rates on overall profitability was largely invisible to decision-makers.

Solution Approach

A structured, four-phase methodology was applied — from raw data ingestion to polished dashboard delivery — ensuring every insight is built on a clean, reliable, and scalable analytical foundation.

Data Cleaning

Used Power Query to remove duplicates, handle nulls, standardize formats, and prepare data for modeling

Star Schema Modeling

Designed a clean star schema with one fact table and five dimension tables for optimal query performance

KPI Creation via DAX

Wrote DAX measures to calculate revenue, profit margin, return rate, and other critical business KPIs

Dashboard Development

Built a 4-page interactive Power BI dashboard with slicers, visuals, and drill-through capabilities

Dataset Overview

The analysis is powered by the Kaggle Nike Sales Dataset — a rich, historical transactional dataset covering products, regions, discounts, and returns.

Source

Kaggle

Format

CSV

What the Dataset Includes

- **Sales Transactions** — Historical records of all sales activity over time
- **Product Details** — Category, type, and product-level attributes
- **Regional Data** — Geographic breakdown enabling location-based analysis
- **Discount Records** — Discount rates applied per transaction
- **Returns Data** — Product return logs to measure return rate impact

Data Model: Star Schema

The star schema design places Fact_Sales at the center, surrounded by five dedicated dimension tables. One-to-many relationships connect dimensions to the fact table, enabling efficient slicing and aggregation across every analytical dimension.

Key KPIs Tracked

Five core KPIs were defined using DAX to give stakeholders a comprehensive view of Nike's sales health — from top-line revenue down to return rate efficiency.

Total Revenue

Gross income generated from all sales transactions across regions and channels

Total Profit

Net earnings after deducting cost of goods sold and discount impacts

Units Sold

Total quantity of products sold — a key indicator of demand and inventory turnover

Profit Margin

Ratio of profit to revenue, revealing how efficiently the business converts sales to earnings

Return Rate

Percentage of units returned — a critical quality and customer satisfaction signal

Dashboard Overview: 4 Pages

The final Power BI dashboard is organized into four dedicated pages, each designed to answer a specific business question – from high-level performance to granular discount and customer analysis.

1

Sales Performance Overview

Monthly revenue trends, regional breakdowns, and top-line KPI cards for an executive summary view

2

Product Performance Analysis

Revenue and units sold by product category, with filters to identify top and bottom performers

3

Discount & Profit Analysis

Correlation between discount depth and profit margin – revealing where discounts hurt the bottom line

4

Customer & Return Analysis

Return rates by product and region, plus customer behavior patterns affecting satisfaction and revenue

Key Insights & Recommendations

What the Data Revealed

- Seasonal Revenue Shifts** — Revenue fluctuates significantly across months and regions, signaling untapped planning opportunities
- Bangalore Leads** — Consistently the top-performing region by both revenue and units sold
- Running Category Dominates** — Running products generate the highest revenue across all product lines
- Discounts Erode Profit** — Higher discount rates show a clear negative correlation with profit margin

Strategic Recommendations

- **Optimize Discount Strategy** — Cap discounts at a margin-safe threshold; use targeted promotions instead of blanket reductions
- **Double Down on Top Products** — Increase inventory and marketing investment in high-performing Running category products
- **Reduce Return Rates** — Investigate root causes of returns by product and region; improve size/fit guidance
- **Boost Digital Sales Channels** — Strengthen e-commerce presence to capture underperforming digital revenue potential

Conclusion & Thank You

This Power BI dashboard transforms raw Nike sales data into a strategic decision-making tool – giving business teams the clarity, speed, and confidence to act on what matters most.

Actionable Insights

Every dashboard page is designed to surface insights that are immediately usable by business and sales teams

Scalable Architecture

The star schema model and DAX framework can be extended with new data sources or KPIs as the business grows

Better Decisions, Faster

With centralized visibility, Nike teams can move from gut instinct to data-backed strategy at every level
